

Cover Letter — Freelance Data Partnerships Lead

To Olga Megorskaya, Founder & CEO, Toloka AI

Hi Olga,

You're hiring the first person in a function that will find companies that never sold data before — factories, warehouses, pharmacies, restaurants — open their doors, and turn their operational data into a paying, repeatable pipeline. I've done the exact motion, on the other side of the table, at the same deal sizes: I sold and closed **monday.com**, **Guardio**, **CirclesUp**, **8fig**, **thirdweb** and **NewDayUSA** from \$100K/year up to \$100K/month, personally carried sales through delivery and customer success, and **re-signed monday.com multiple times** — through the monday dev GTM launch, several POC changes, and internal team reshuffles. That was selling, not buying, but the concept is the same: find the benefit, address the concern, structure the pilot, scale it.

I've sold to every decision structure there is — a single founder deciding in one call, a multi-layered committee, a flat board — so I adapt the pitch to whoever actually holds the pen, and I can carry a deal from the owner's desk to legal and procurement without losing it.

Two things matter most for this role, and both are what I actually do.

First — the outbound machinery. Data partners won't come inbound. I've built my own lead qualification, verification, and email-validation pipelines using monid, treg, AI Ark, BounceBan, maps data, and residential proxies for building lead lists at scale. I run cold outbound through ListKit or a custom build plus LinkedIn automation — comfortably reaching tens of thousands of prospects a month. And I've set up the delivery stack that makes it actually work: cold-email infrastructure, domain warm-up, sending-campaign management, and cold-calling infrastructure (Zadarma). For a founding role, that's the difference between a pipeline and a hope.

Second — the domain. For the past quarter I've owned a slice of Tasq AI's GTM (AEO/GEO/SEO), so I'm well versed in the regulatory environments around AI and data, how a company's data can be turned into something useful — even for the company itself — and robotics/physical AI, which is exactly Toloka's solution space. And I hold a Master's in Big Data & Business Analytics, so I understand the ML and computer-vision side of the pipeline too — how data gets processed for CV and robotics use cases, and with what tools. When a warehouse owner asks "why should I sell my data?", I can answer in the language of their own operations, and then explain where it goes.

If I were building your partner pipeline, here's where I'd go first: **warehouses and logistics firms** — rich operational data, cost pressure, low regulatory friction, and a clear efficiency story; then **factories** with sensor/IoT data, where robotics and physical-AI use cases land directly; then **restaurants**, where the SMB owner decides in one call; and **pharmacies** sequenced after, because health-adjacent compliance needs handling head-on — which I've done at a HIPAA-regulated product (FormDR).

I work on a freelance B2B contract, fully remote, 40h/week — aligned with the role. I'd start by mapping the 90 days to your own success bar: 2–3 collection partners signed across 2+ regions, a qualified lead pipeline, and a partner playbook the next hires can run.
